EDUCATION

Massachusetts Institute of Technology

Cambridge, MA

Bachelor of Science in Electrical Engineering and Computer Science

Aug. 2025 - Expected May 2029

Relevant Coursework: CS in Python, C and Assembly, Differential Equations, Discrete Math, Algorithms

Activities: AppDev@MIT, Human Technology Integration Club, MIT Motorsports

EXPERIENCE

MIT Department of Brain and Cognitive Sciences

Cambridge, MA

Undergraduate Researcher

Jan. 2026 - Present

- Extended the open-source AccuSleepPy codebase with EEG spectral-analysis features, developing power-distribution visualizations and automated calculations to aid manual sleep-stage scoring.
- Built a Python tool that decodes raw binary EEG/EMG recordings into CSV format, enabling the lab's acquisition data to be analyzed in AccuSleepPy.

Coded By

Philadelphia, PA

Software Engineering Intern

Jun. 2026 - Aug. 2026

- Developed a context layer for AI agents at enterprise, consolidating information from company communication platforms (e.g. Notion, Google Drive) into a knowledge graph that agents could query via a remote MCP server.

EXTRA-CURRICULAR ACTIVITIES

MIT Motorsports

Telemetry Team

Aug. 2025 - Dec. 2025

- Co-built a full-stack telemetry platform (Next.js, FastAPI, MongoDB) that gives engineers across MIT Motorsports subteams on-demand access to racecar data such as speed, voltage, and temperature readings.
- Designed and shipped a "functions" feature that lets users write and save Python code to transform and plot telemetry in-app, making new visualizations much faster to produce.

SLAM Robotics

Software Team

Sep. 2021 - Jun. 2025

- Led software team of 6+ members, onboarding members, overseeing system design, and guiding game strategy.
- Integrated computer vision, autonomous movement, and macros into robot using Java and OpenCV.

PROJECTS

Personalized Robotics Assistant | *Next.js, Supabase, Assistants API*

Created a web app to help guide my robotics teammates through the competition. It featured a personalized assistant capable of answering highly specific questions that were tailored to the competition using RAG.

Brainwave Reader | *C#, .NET, Arduino*

Developed a program that could interpret raw Bluetooth data from a EEG chip and control a relay switch based on brain activity.

Autonomous Robot | *Python*

Worked with 5 others to create an autonomous robot for MIT's MASLAB competition. Focused on autonomous movement using computer vision and pure pursuit on a differential drive. Awarded Wilken's Design Award.

SKILLS

Technical Skills

HTML/CSS, JS/TS, React, SQL, Java, Python, C, FastAPI, Git

Soft Skills

Communication, Teamwork, Problem-Solving, Adaptability, Time Management
